SESSION 3: Enhancing links in the early warning chain

Flood early warning: linking regional, national and local levels

Experiences from the Philippines

UN-SPIDER EWEM
Bonn, 25/26 June 2013

Olaf Neussner, GIZ Philippines
Johannes Anhorn, South Asia Institute, Heidelberg University

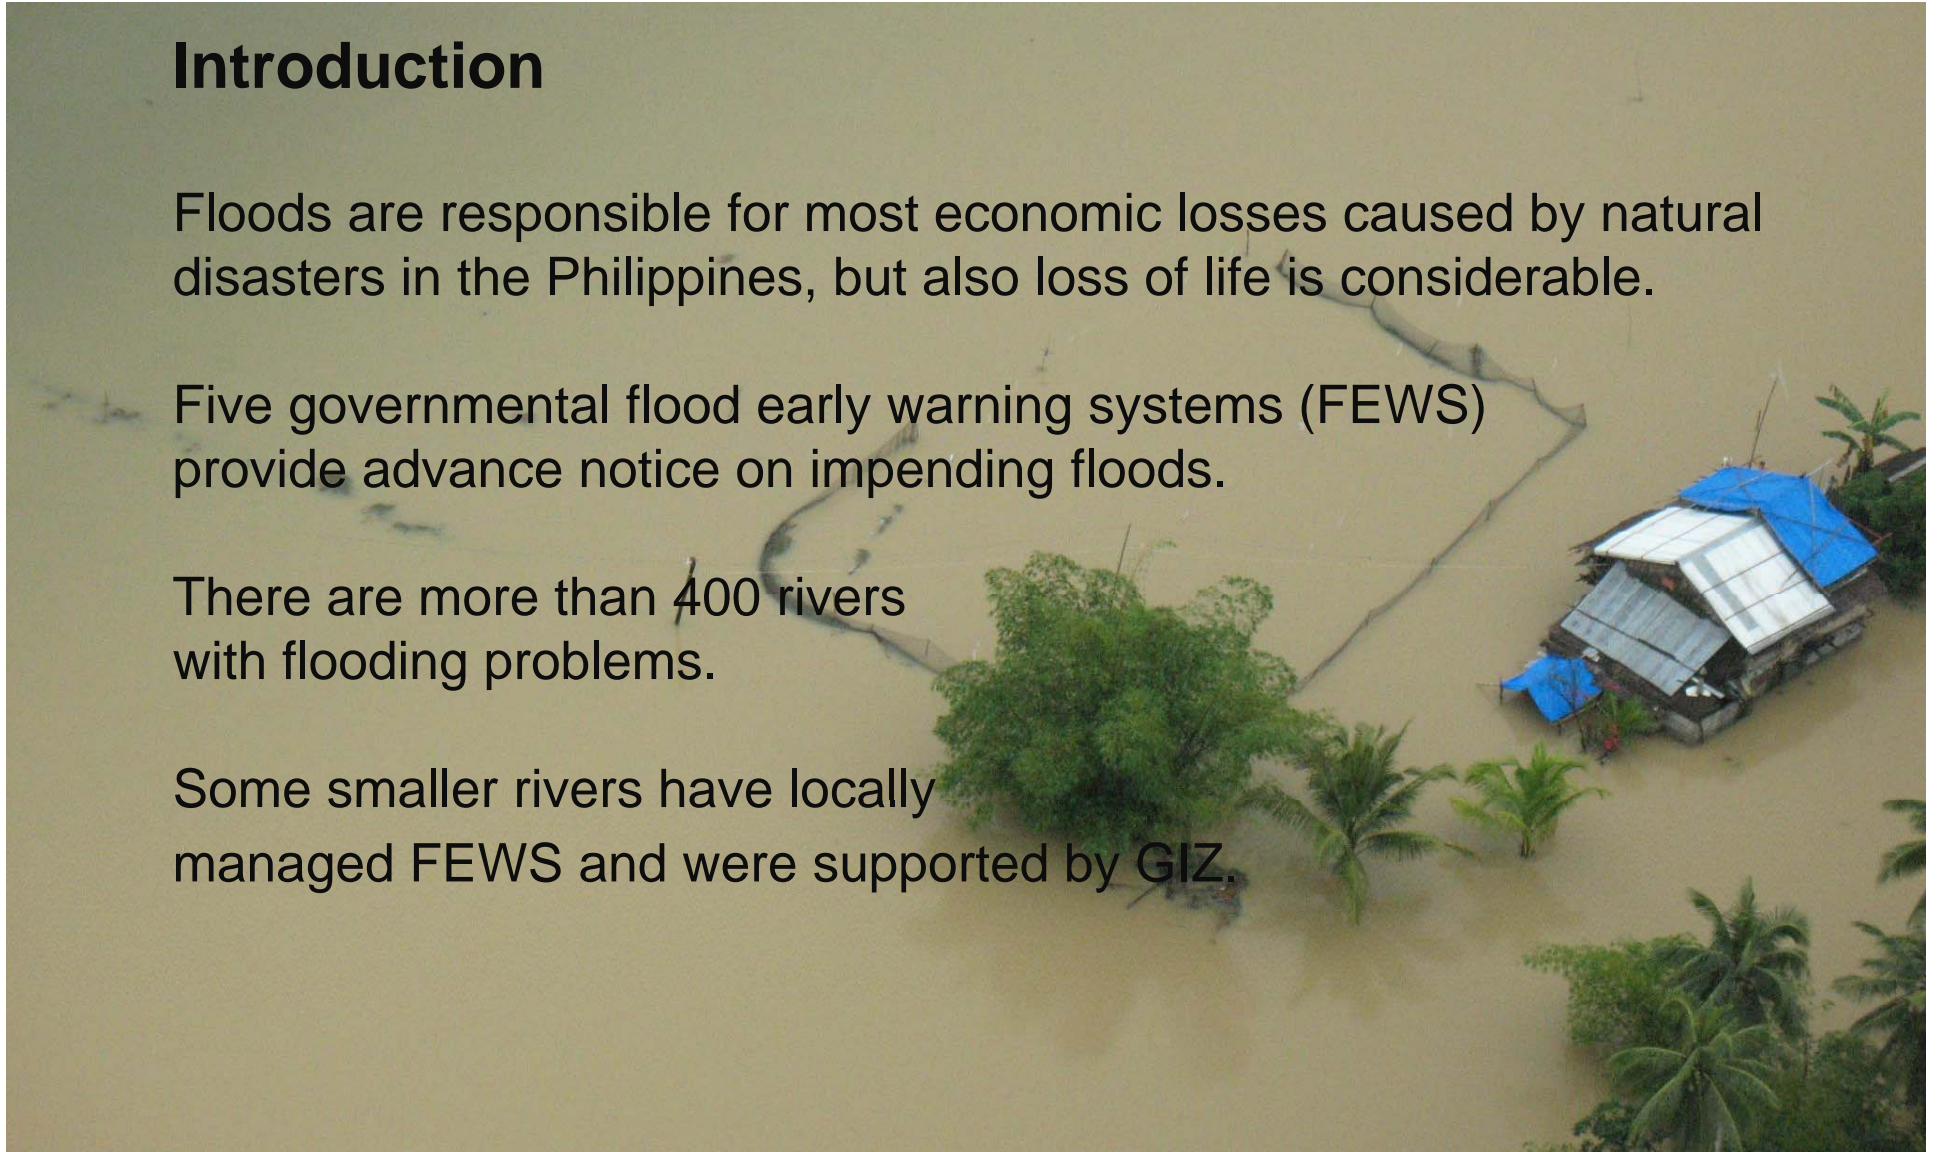

Introduction

Floods are responsible for most economic losses caused by natural disasters in the Philippines, but also loss of life is considerable.

Five governmental flood early warning systems (FEWS) provide advance notice on impending floods.

There are more than 400 rivers with flooding problems.

Some smaller rivers have locally managed FEWS and were supported by GIZ.

Examples of RS support for FEWS

ASTER DEM as basis for flood modelling

a) ASTER DEM, Version 2

b) ASTER DEM, with GIZ corrections

Flood Extent Mapping from HighRes TSX Data

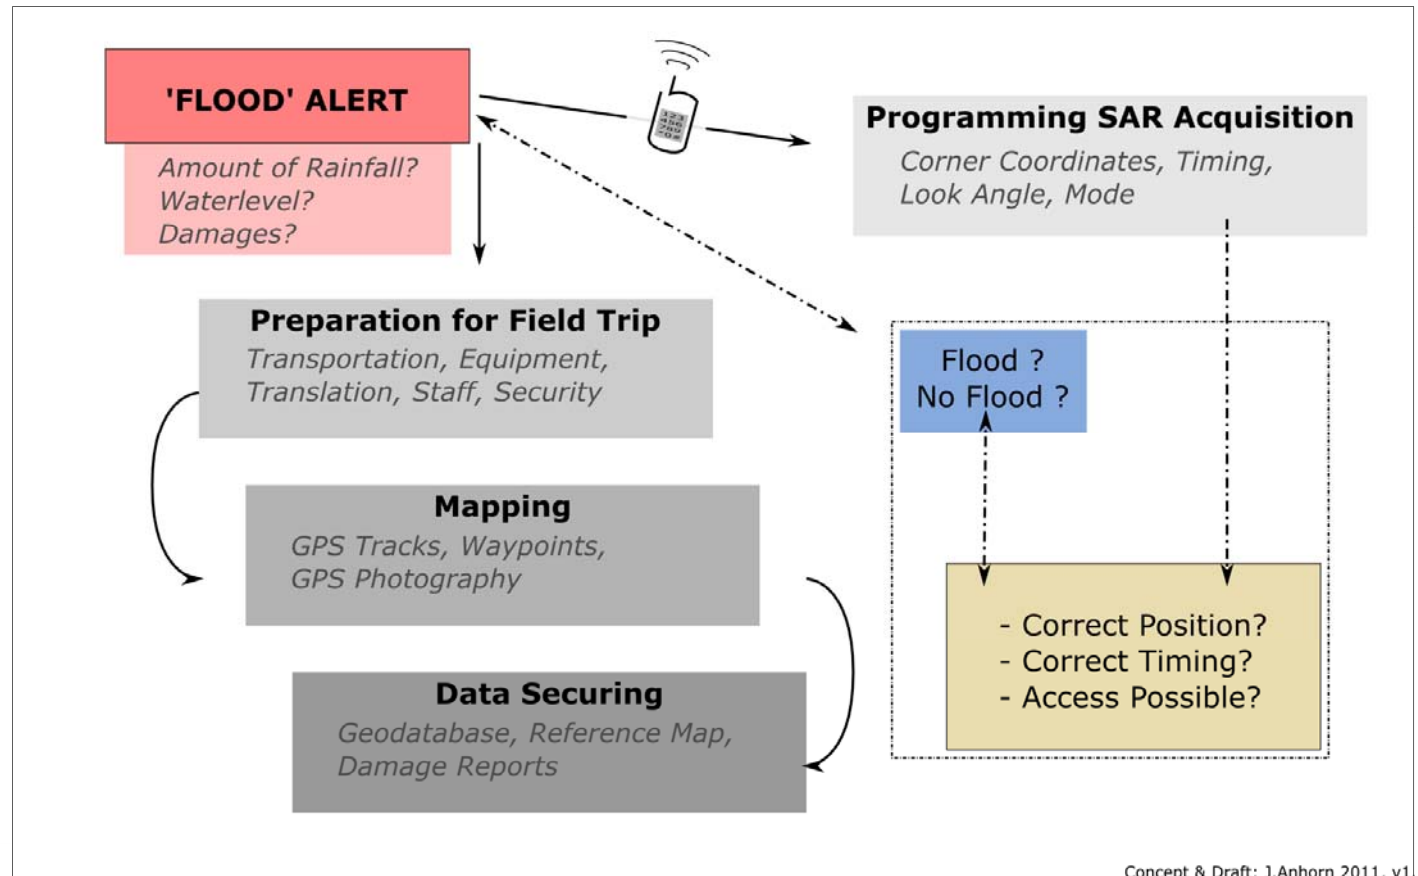

→ Linking global, national, and local efforts

Project Background

- Joint project of DLR and GIZ with different objectives:
 - How can existing flood extent mapping methods and algorithms be enhanced with on-the-ground field data?
 - How can high resolution Synthetic Aperture RADAR Data enhance the whole DRM 'cycle' and provide useful data for local FEWS?
- Aim: Identify the flood extent on a NRT basis with semi-automatic algorithms beneficial for local FEWS.

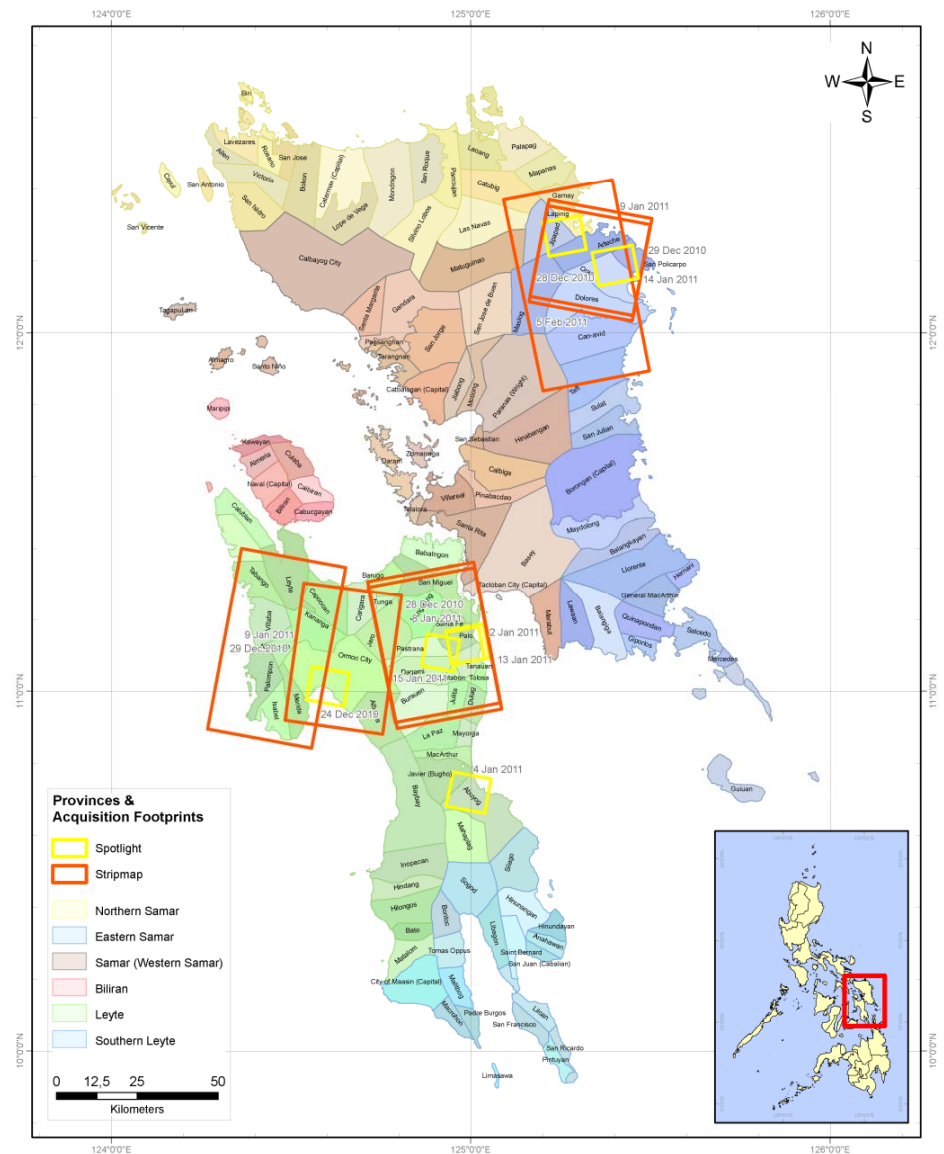

Flood Extent Mapping for Better *Risk Knowledge*

Summary

FEWS are depending to a large extent on terrestrial data collection (rain and water level).

The precision of the systems are enhanced with RS in areas with few ground data:

- Rain (TRMM) in Google Earth with watershed vector files
- DEM data for flood modelling
- Radar data for flood extent maps and better risk communication

Better timing and localizing of warning and evacuation mean better performance of the FEWS.
